Protocol for the CLEARWATER study

Synthetic pipeline test document

Version 1.0 | 2026-10-29 | Study CW-EXAMPLE

All study details are invented for software testing. No real participants, treatment recommendations or patient-level data are included.

1 Trial design and objective

This English-language study is a two-arm, parallel-group randomised superiority trial with a continuous primary endpoint at a fixed time point.

Objective: compare investigational treatment with placebo on change in fatigue score in adults with a synthetic rare disease.

Eligible population: adults aged 18 years or older with the synthetic study condition.

Treatment comparison: investigational treatment versus placebo. Allocation is 1:1.

2 Primary endpoint

The primary endpoint is change from baseline in fatigue score at Week 12.

Fatigue is measured with the invented CLEAR score, ranging from 0 to 100; a lower score indicates less fatigue. Baseline is the pre-randomisation assessment.

3 Primary analysis and sample size

The primary analysis population is intention-to-treat.

Include all randomised participants according to their assigned treatment group, irrespective of treatment adherence.

Primary analysis: analysis of covariance of the Week 12 change, adjusted for baseline fatigue score.

A total of 120 participants will be randomised.

Allocation is equal: 60 participants per arm. The sample size rationale names the Week 12 change in CLEAR fatigue score; this example does not validate statistical power.

Outcomes after treatment discontinuation will continue to be collected and included in the primary comparison. Missing observations will be addressed by multiple imputation.

4 Schedule of primary assessments

Assessment	Baseline	Week 12	Week 24
CLEAR fatigue score	Yes	Yes	Optional

Week 12 is Day 84 after randomisation. The permitted visit window is plus or minus 3 days; the target assessment time remains Day 84.

5 Collection responsibilities and supporting documents

The site coordinator collects the questionnaire; a trained deputy covers absences. The data manager checks completion before database lock.

Laboratory processing details are delegated to the laboratory manual. That manual is not supplied in this test pack; its contents are outside this review.
